Education

Tsinghua University, Beijing, China 2013 – Present

PhD student in Computer Science and Technology

University of California, Santa Cruz, California, America November 20, 2017 – May 20, 2018

Visiting Scholar Advisor: Cedric Westphal

Jilin University, Changchuni, China 2009 – 2013

B.S. in Software Engineering

Projects

Software development of cloud computing support Infrastructure Sep, 2013– Now

As an important tool for building virtual computing environment in the cloud computing platform of Tsinghua University, the platform can quickly build the required virtual computing cluster (KVM/LXC) according to the user's requirement. Users can customize the type of virtual machine (KVM/LXC) by clicking the browser. The allocation and recovery of resources could be automatically achieved, which provides a more efficient and reliable running virtual platform for the entire cluster.The project provides data center version and edge computing version respectively according to the choice of adjusting image storage mode and migration strategy.

- Support self-defined software installation and KVM/LXC on-line migration;
- Based on image redundancy storage, the migration capability of virtual cluster in WAN will be optimized for supporting Edge Cloud version.

In-network Caching Sep, 2015 – Now

In content distribution and 5G wireless networks, in-network caching has become an important solution for efficient data transmission in using network resources. Based on the acquisition of transport protocol features (e.g., TCP / IP, ICN, etc.), this project obtains cache metrics and proposes distributed content placement strategies for supporting network cache architecture.

- A Bayesian ranking model is used to cache content with the aggregation caching features;
- A network partitioning scheme is put forward to avoid metadata flooding and reduce the complexity of the caching model;
- The proposed approach can reduce 56% content access latency.

Immersive Video Stream Networking Nov, 2017 – Now

Immersive video stream has the problems of unnecessary data transmission and high quality QoE requirement in the AR/VR network field. The project aims to predict immersive video user behavior information and select appropriate video content based on network delay estimation as well as adjusting video bit rate.

- Combining the network delay, we adjust the bit rate and the user's field of view adaptively;
- It improves the bit rate of about 1.34×and has a better QoE;
- In addition, a user behavior simulation tool based on Markov model and Beta distribution is implemented.

Others Jan, 2016 – Now

- Participating in the key technology research of big data transmission by the National Natural Science Foundation of China;
- Design and development of disaster recovery Software Suite;
- Participating in the research on Key Technologies of multidimensional climate data storage and processing;
- Participating in the Key technologies of cloud service integration platform and implementation of distributed storage system.

Prizes

First prize of RenMinWang Scholarship in Technical Subjects	NoV, 2018
First prize in the Sixth Student RDMA Programming Competition	Oct, 2018
National Scholarship of China	2011-2012
Meritorious prize in Mathematical Contest in Modeling (MCM)	2011-2012

Academic Talk

MCPC: Improving In-network Caching by Network Partition	December 2018, Singapore
Joint Rate and FoV adaptation in immersive video streaming	August 2018, Hungary
A PIT-Driven Approach to In-network Caching for Named Data Network	March 2018, The USA
EDTS: An Extensible Data Transmission Service for the Internet	August 2013,China

Other Information

- Reserch Interest: Distributed System, Cloud/Edge Computing, Networking
- Acadamic experice: NSDI 2018, Sigcomm 2018, IPCCC 2018, ICPADS 2018, ICPP 2015(External Reviewers), IEEE Transactions on Multimedia review
- Program language: C/C++, Java, Python
